# **A SocioEconomic Profile 4 County Aggregation**

**Ferry WA, Okanogan WA, Pend Oreille WA, and Stevens WA**

Produced by the  
**Economic Profile System (EPS)**  
July 24, 2007

---

### About The Economic Profile System (EPS)

This profile was produced using the 2007 version of the Economic Profile System (EPS), last updated in June 2007. EPS is designed to allow users to automatically and efficiently produce detailed socioeconomic profiles at a variety of geographic scales using the spreadsheet program Microsoft Excel.

Profiles contain tables and figures that illustrate long-term trends in population; employment and personal income by industry; average earnings; business development; retirement and other non-labor income; commuting patterns; agriculture; and earnings by industry.

Databases used for EPS profiles are from: Bureau of the Census, County Business Patterns, Bureau of Labor Statistics, and the Regional Economic Information System (REIS) of the Bureau of Economic Analysis, U.S. Department of Commerce.

EPS was developed in partnership with the Bureau of Land Management by Ray Rasker, Jeff van den Noort, Ben Alexander and Patty Gude when they were employees of the Sonoran Institute, and continues to be refined and improved by these authors under the auspices of their new organization, Headwaters Economics.

EPS is available for free download from Headwaters Economics ([www.headwaterseconomics.org](http://www.headwaterseconomics.org)).

For technical questions about EPS, contact Jeff van den Noort at [jeff@headwaterseconomics.org](mailto:jeff@headwaterseconomics.org).

[www.headwaterseconomics.org](http://www.headwaterseconomics.org)

**Headwaters Economics** conducts social science research to understand demographic and socioeconomic trends and their impacts on changing land use patterns. We use this knowledge to assist individuals, organizations and communities to benefit from their competitive advantages.

[www.blm.gov](http://www.blm.gov)

**The Bureau of Land Management (BLM)**, an agency within the U.S. Department of the Interior, administers 262 million surface acres of America's public lands, located primarily in 12 Western States. The BLM sustains the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations.

## 4 County Aggregation

## Read This First

There are two related systems for producing socioeconomic profiles: this one, the Economic Profile System (EPS) and the Economic Profile System Community (EPSC). For best results, use both profile systems. Below is a table highlighting how the two systems complement each other.

	EPS	EPSC
Geographic level of detail	Nation Region (metro, non-metro, total) State (metro, non-metro, total) County	Nation, Region, Division, States, Counties, County Subdivisions, Places (Towns), Indian Reservations, Congressional Districts
Databases used	Bureau of the Census (Census) County Business Patterns (CBP) Bureau of Labor Statistics (BLS) Bureau of Economic Analysis (BEA), Regional Economic Information System (REIS)	Bureau of the Census, Decennial Census of Population and Housing, 1990, 2000. (1990 to 2000 comparisons at the county level only)
Time series used	Continuous data from 1970 to as close to the present as possible.	2000. At the county level only 1990 to 2000 comparisons can be made to show changes in age and household income distribution.
Advantages	Long-term trend analysis; changes in employment and personal income by sector, change of businesses establishments by type and size, and non-labor sources of income, like retirement and age-related income.  Counties are compared to states and nation.	Age distribution, race, housing costs, housing affordability, education rates, poverty.  Finer geographic detail.  Allows comparisons to user-selected 'benchmark' areas.
Disadvantages	For some counties employment and personal income data may be suppressed for some industries and for some years. EPS includes a system for estimating these data gaps, and a chapter in the EPS User's Manual profiles step-by-step instructions.	Census data is not suppressed, but it is less useful than REIS data used in EPS for long-term trends by industry; it is only available only for 2000.

### Important notes:

- Total employment figures from the Bureau of the Census (used in EPSC) and the Regional Economic Information System (used in EPS) can differ for the following reasons:
  - Census employment figures are reported by place of residence, while BEA REIS figures are by place of work.
  - BEA REIS counts all jobs, regardless of whether part-time or whether a person has several jobs. For example, if a person has three part-time jobs, they count it as three jobs.
  - In some areas seasonality may play a role: the census is taken in the spring, a shoulder season for many "resort" areas, while BEA REIS data is an annual average.
- Tables and charts may be copied from Excel into any other program, like Word or PowerPoint: highlight the selection, choose copy from the edit menu, then open Word or PowerPoint and insert by choosing "Paste Special" in the Edit Menu. We recommend that you paste charts as a picture.
- EPS is updated every year with the latest figures.
- This profile also shows business cycles, represented as vertical bars on selected charts.

The following pages (2-25) contain long-term trends in demographics, employment and income, for types of information **where no disclosure restrictions occur**.

### What is a 'disclosure restriction'?

A disclosure restriction means a gap exists in the data. Information has been suppressed by the U.S. Department of Commerce to avoid disclosure of confidential information. Generally, the smaller the geographic level of analysis and the smaller the population of the county, the higher the chances that industry-specific information is suppressed and that disclosure restrictions will occur.

The last section of this profile contains long-term trends on employment and personal income by industry sector (services, retail trade, manufacturing, etc.). This type of data often has data gaps, or disclosure restrictions. EPS has a built-in system for estimating data gaps through 2000 for the 11 contiguous western states (AZ, CA, CO, ID, MT, NM, NV, OR, UT, WA, WY).

### In this section you will learn about:

1. Changes in population, age distribution, household income distribution and housing affordability.
2. Comparisons of the county to the state and the nation.
3. Employment and income by type: proprietors versus wage and salary.
4. Personal income by type: labor versus non-labor income.
5. The role of transfer payments.
6. How well do we recover from recessions?
7. Trends in government employment.
8. Earnings per job versus per capita income.
9. Growth in firms by size and industry type.
10. Unemployment rates.
11. Cross-county flow of dollars via commuting.
12. Trends in agricultural businesses.

### Highlights\*\* - In 4 County Aggregation:

- Population Growth (Annualized rate, 1970-2005) was somewhat fast.
- Employment Growth (Annualized rate, 1970-2005) was somewhat fast.
- Personal Income Growth (Adjusted for Inflation, Annualized rate, 1970-2005) was somewhat fast.
- Non-labor Income Share of Total in 2005 was somewhat high.
- Median Age\* was somewhat old.
- Per Capita Income (2005) was somewhat low.
- Average Earnings Per Job (2005) was roughly average.
- Education Rate (% of population 25 and over who have a college degree)\* was roughly average.
- Employment Specialization\* was somewhat diverse.
- Ratio Rich/Poor (Number of households that made under \$30K for every household that made over \$100K)\* was roughly average.
- Housing Affordability (100 or above means that the median family can afford the median house)\* was somewhat less affordable.
- Government share of Total employment was high.
- Unemployment Rate in 2006\*\* was high.

\*\*These highlights are based on how this area compares to the distribution of all of the counties in the United States. See the methodology section at the end for more information.

\* from 2000 US Census \*\* from Bureau of Labor Statistics

Population

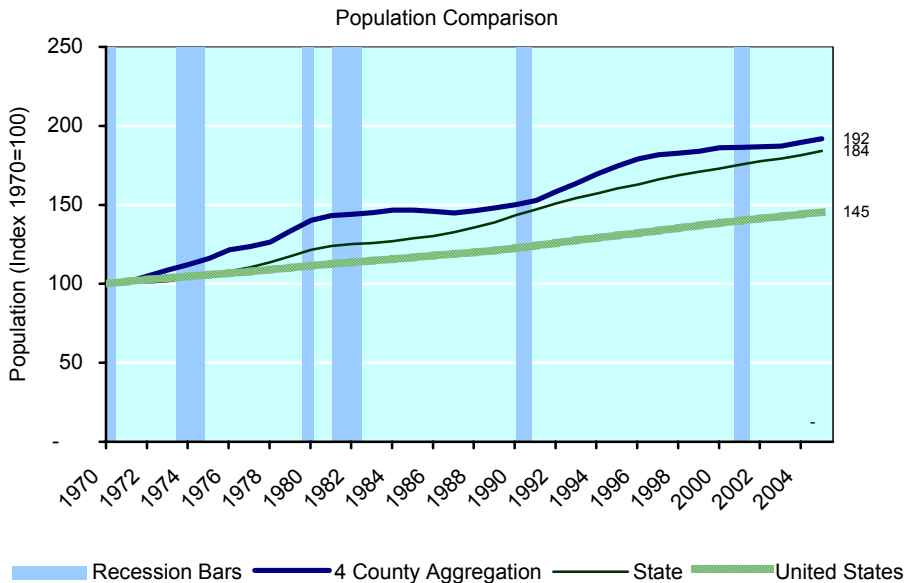

- From 1970 to 2005 population grew by 48,739 people, a 92% increase in population.
- At an annual rate, this represents an increase of 1.9%.

The vertical shaded bars on the figure below represent the last five recession periods: November 1973 to March 1975; January 1980 to July 1980; July 1981 to November 1982; July 1990 to March 1991; March 2001 to November 2001. More information about recessions is available on the next page.

Population Growth Compared to the State and the Nation

- Over the last 35 years population growth in 4 County Aggregation has outpaced that of the state and the nation.
- Population growth is not generally impacted by national recessions.

Source: BEA REIS 2005 Table CA30

**How well do we recover from recessions?**

An important indicator of economic performance is the ability to recover quickly from recessions.

A recession is defined by the National Bureau of Economic Research as “a significant decline in activity spread across the economy, lasting more than a few months, visible in industrial production, employment, real income, and wholesale-retail sales.”

The graph below shows how well we have recovered from the last five recessions. The recovery period used is from the end of one recession (the trough) to the beginning of the next recession (the peak).

This type of graph is repeated throughout the profile to show how the region recovers from recessions compared to the state and the nation.

See <http://www.nber.org/cycles.html> for more information about business cycles.

- In the latest recovery (2001 to 2005), population growth in State (up 1.2%) outpaced the United States and 4 County Aggregation.
- Alternatively, in the last recovery (1991 to 2001), 4 County Aggregation (up 2.0%) grew the fastest.
- In the recovery from 1982 to 1990, State (up 1.7%) grew the fastest.

Source: BEA REIS 2005 Table CA30

(From EPSC)

- The population has gotten older since 1990. The median age in 2000 is 39.2 years, up from 34.8 years in 1990.
- The largest age category is 10 to 14 years old (8,597 people or 8.7% of the total).
- Total Population in 2000 was 98,622 people, up 24% from 79,508 in 1990.
- The age group that has grown the fastest, as a share of total, is 50 to 54 years, up 3,366 people. Their share of total rose by 2.4%

Population by Age and Sex

	Total Number	Under 20 years Number Share	40 - 54 (Baby Boom in 2000) Number Share	65 years and over Number Share	Median Age	Density (Pop. per sq. mi.)
Total Population						
2000	98,622	30,062 30%	23,888 24%	13,382 14%	39.2	9
1990	79,508	25,851 33%	15,011 19%	10,396 13%	34.8	7
10 Yr. Change	19,114	4,211 -2%	8,877 5%	2,986 0%	4.4	2
10 Yr. % Change	24%	16%	59%	29%	13%	24%
2000 Sex Breakout						
Male	49,291	15,452 31%	11,938 24%	6,228 13%	38.8	
Female	49,331	14,610 30%	11,950 24%	7,154 15%	39.6	
Male/Female Split	50% / 50%	51% / 49%	50% / 50%	47% / 53%		

2000 Table SF1 - P12 & 1990 SF1 Table P05 & P12

In the graphs below, changes in population by age are shown two ways. The "Change in Population" graph illustrates how each age bracket has changed in the last 10 years. The "Change in Share" graph illustrates how each category has changed as a share of total. Note that an age bracket can have an increase in population while declining as a share of total. The "Change in Share" graph usually demonstrates how the baby boom has caused a demographic shift in the population (growth in the 40-60 age brackets).

Note: In aggregated profiles, medians are interpolated.

Source: Census 2000 and Census 1990

## Income Distribution

- In 1999, for every household that made over \$100K, there were 11.1 households that made under \$30K. 10 years earlier, for every household that made over \$100K, there were 55.0 households that made under \$30K.

- Please note that the income distribution is not adjusted for inflation so some of the changes are due to inflation.

## Housing Affordability - Owner Occupied

- The housing affordability index is 133, which suggests that the median family can afford the median house. \*
- Housing affordability has become less affordable in the last decade, from 145 in 1990 to 133 in 2000.

Owner Occupied Housing Affordability	1990	2000
Specified owner-occupied housing units: Median value (Adjusted for	\$ 69,829	\$ 99,400
% of median income necessary to buy the median house	17%	19%
Income required to qualify for the median house	\$ 23,551	\$ 28,087
Housing Affordability Index: (100 or above means that the median family can afford the median house.)*	145	133
Universe: Specified owner-occupied housing units		SF3 - H76

Income in:	1989	1999
Median household income (Adj. for Inflation in 2000 \$)	\$ 29,439	\$ 31,890
Median family income (Adj. for Inflation in 2000 \$)	\$ 34,265	\$ 37,404
Universe: Total population, Households, Families		SF3 - P82,P53,P77

\* Note: The housing affordability figures assume a 20% down payment and that no more than 25% of a family's income goes to paying the mortgage. It is based on an interest rate of 10.01% in 1990 and 8.03% in 2000. Use this statistic as a comparative, rather than absolute, measure.

Note: In aggregated profiles, medians are interpolated.

Source: Census 2000 and Census 1990

Long term trend

- From 1970 to 2005, 23,119 new jobs were created.
- From 1970 to 2005, the majority of job growth, 67% of new jobs, has been in wage and salary employment (people who work for someone else).
- Employment of wage and salary employment (people who work for someone else) contributed to 67% of new employment from 1970 to 2005, and 64% of new employment since 1995.
- In 1970, proprietors represented 24.8% of total employment; by 2005, they represented 28.6%.

Wages and Salaries vs. Proprietors									
Changes from 1970 to 2005									
	1970	% of Total	1995	2005	% of Total	New Employment (70-05)	% of New Employment	New Employment (95-05)	% of New Employment
Total full-time and part-time employees	23,695		43,817	46,814		23,119		2,997	100.0%
Wage and salary jobs	17,814	75.2%	31,501	33,417	71.4%	15,603	67.5%	1,916	63.9%
Number of proprietors	5,881	24.8%	12,316	13,397	28.6%	7,516	32.5%	1,081	36.1%
Number of nonfarm proprietors 5/	3,041	12.8%	8,846	10,242	21.9%	7,201	31.1%	1,396	46.6%
Number of farm proprietors	2,840	12.0%	3,470	3,155	6.7%	315	1.4%	-315	NA

**Proprietors** include sole proprietorships, partnerships, and tax-exempt cooperatives. A sole proprietorship is an unincorporated business owned by a person. A partnership is an unincorporated business association of two or more partners. A tax-exempt cooperative is a nonprofit business organization that is collectively owned by its members.

**Wage and salary** employment refers to employees.

Source: BEA REIS 2005 Table CA30

How well do we recover from recessions?

- In the latest recovery (2001 to 2005), employment growth in State (up 1.2%) has outpaced the United States and 4 County Aggregation.
- Similarly, in the last recovery (1991 to 2001), State (up 2.1%) grew the fastest.
- In the recovery from 1982 to 1990, State (up 3.9%) grew the fastest.

■ 4 County Aggregation - Employment ■ State - Employment ■ United States - Employment

Job Growth Compared to the State and the Nation

- Over the last 35 years job growth in 4 County Aggregation has been slower than the state and faster than the nation.
- Some areas can experience employment gains even during the recessions. If so, check to see how much is due to migration and population changes.

Source: BEA REIS 2005 Table CA30

Long term trend

- From 1970 to 2005, personal income added \$1,491 million in real terms.
- The annualized growth rate was 2.8%.

Importance of Proprietors

- In the last 35 years, wage and salary disbursements grew at an annual rate of 1.8%, outpacing proprietors' income which grew at a 1.3% rate.
- 10.7% of new labor income from 1970 to 2005 was from proprietors' income.

Wages and Salaries vs. Proprietors								
All income in millions of 2005 dollars	1970		1995		2005		New Income 70-05	% of New Income
	1970	% of Labor	1995	% of Labor	2005	% of Labor		
<b>Labor Sources</b>	629	100%	1,139	100%	1,385	100%	756	100.0%
Wage and salary disbursements	485	77%	793	70%	896	65%	411	54.4%
Proprietors' income	139	22%	178	16%	219	16%	81	10.7%
Nonfarm proprietors' income	108	17%	156	14%	197	14%	89	11.8%
Farm proprietors' income	31	5%	22	2%	22	2%	(9)	NA

**Wage and salary** is monetary remuneration of employees, including employee contributions to certain deferred compensation programs, such as 401(K) plans.

**Proprietors** is income of sole proprietorships, partnerships and tax-exempt cooperatives. A sole proprietorship is an unincorporated business owned by a person. A partnership is an unincorporated business association of two or more partners. A tax-exempt cooperative is a nonprofit business organization that is collectively owned by its members.

Source: BEA REIS 2005 Table CA05N and CA30

**Definitions:**

“Proprietors” refers to employment and income from sole proprietorships, partnerships, and tax-except cooperatives.  
 “Wage and salary” refers to employees; people who work for someone else.

**Are proprietors an important indicator of economic health?**

Growth of proprietor employment and income can be a healthy sign that opportunities for entrepreneurship exist. Another way to gauge the health of small business growth is to look at changes in businesses by type and size of establishment (later in this profile).

Growth of proprietors can also mean that a rising number of people in the community want to (or need to) have side jobs in addition to their wage and salary jobs. When this is the case, earnings from second jobs can pull down average wages. To see if this is a sign of stress, look for other potential stress indicators in this profile: unemployment rates over time and changes in earnings per job.

**Proprietors' Share of Total (Income vs. Employment)**

- In 2005, proprietors' share of total employment (29%) was higher than proprietors' income share of total (9%).
- From 1970 to 2005, proprietors' income share of total fell by 40.6%, while proprietors' employment share of total grew by 15.3%.

**How are Proprietors Doing?**

- From 1970 to 2005, average wage and salary disbursements fell at an annualized rate of 0.0% (adjusted for inflation), declining slower than average nonfarm proprietors' income, which fell by 1.7%.
- In 2005, average wage and salary disbursements were \$26,816 (adjusted for inflation), more than average nonfarm proprietors' income (\$19,268).
- In 1970, it was the other way around. Average nonfarm proprietors' income was \$35,476 (adjusted for inflation), more than average wage and salary disbursements (\$27,208).
- If these shares vary widely, it suggests that proprietors and wage earners have different earnings.

Source: BEA REIS 2005 Table CA30

The term "Non-Labor Income" is also referred by some economists as "Non-Earnings Income". It consists of Dividends, Interest and Rent (collectively often referred to as money earned from investments) and Transfer Payments (payments from governments to individuals, age-related, including Medicare, disability insurance payments, and retirements).

(See methods section for definitions and further explanations.)

- In the last 35 years, non-labor sources grew at an annual rate of 3.8%, outpacing labor sources which grew at a 2.3% rate.
- 42.0% of total personal income in 2005 was from non-labor sources.
- 49.3% of new income from 1970 to 2005 was from non-labor sources.

Non-labor income under estimates retirement income because it does not include pensions (401Ks).

Labor vs. Non-Labor										
All income in millions of 2005 dollars	1970		1995		2005		New Income 70-05	% of New Income	% Chg Ann. Rate 70-05	% Chg Ann. Rate 95-05
	1970	% of Total	1995	% of Total	2005	% of Total				
<b>Total Personal Income</b>	896	100%	1,957	100%	2,387	100%	1,491	100.0%	2.8%	2.0%
<b>Labor Sources</b>	629	70%	1,139	58%	1,385	58%	756	50.7%	2.3%	2.0%
<b>Non-Labor Sources</b>	267	30%	818	42%	1,002	42%	735	49.3%	3.8%	2.1%
Dividends, interest, and rent	141	16%	365	19%	375	16%	234	15.7%	2.8%	0.3%
Personal current transfer receipts	126	14%	453	23%	628	26%	501	33.6%	4.7%	3.3%

Percentages do not add to 100 because of adjustments made by BEA, such as residence, social security, and others.

Source: BEA REIS 2005 Table CA30

Components of Transfer Payments							
All figures in millions of 2005 dollars	1970	% of Total TP	2005	% of Total TP	New Payments 1970 to 2005	% of New Payments	Change in Share of Total (1970 - 2005)
Total transfer payments	126.4		627.6		501.2		
Government payments to individuals	119.9	95%	602.0	96%	482.1	96.2%	
Retirement & disab. insurance benefit payments	56.3	45%	241.0	38%	184.7	36.8%	
Medical payments	17.4	14%	255.0	41%	237.6	47.4%	
Income maintenance benefit payments ("welfare")	17.3	14%	61.1	10%	43.8	8.7%	
Unemployment insurance benefit payments	14.1	11%	15.6	2%	1.5	0.3%	
Veterans benefit payments	13.3	11%	25.4	4%	12.1	2.4%	
Federal educ. & trng. asst. pay. (excl. vets)	0.7	0.5%	1.0	0.2%	0.3	0.1%	
Other payments to individuals	0.9	0.7%	2.9	0.5%	2.1	0.4%	
Payments to nonprofit institutions *	3.7	3%	18.6	3%	14.9	3.0%	
Business payments to individuals	2.7	2%	7.0	1%	4.2	0.8%	
Age-related (Retirement, Disability & Medicare)	60.6	48%	323.9	52%	263.3	52.5%	

Trends in Non-Labor Income by Type

- The largest components of Non-Labor Income are from Dividends, Interest & Rent (i.e. money earned from past investments).
- In 2005 welfare represented 9.7% of transfer payments, and 2.6% of total personal income. This is down from 1970 and down from 1980.

Components of Transfer Payments

- In 2005, 52% of Transfer Payments were from age-related sources (retirement, disability, insurance payments, and Medicare), while 10% was from welfare.

\* See glossary for definitions.

Source: BEA REIS 2005 Table CA35

How well do we recover from recessions?

- In the latest recovery (2001 to 2005), income growth in the United States (up 1.5%) outpaced State and 4 County Aggregation.
- Alternatively, in the last recovery (1991 to 2001), State (up 3.7%) grew the fastest.
- In the recovery from 1982 to 1990, State (up 3.8%) grew the fastest.

Income Growth Compared to the State and the Nation

- Over the last 35 years income growth in 4 County Aggregation has been slower than the state and faster than the nation.
- Some areas can experience income gains even during the recessions. If so, check to see how much of the change is due to changes in earnings per job, employment, migration and population changes.

Source: BEA REIS 2005 Table CA30

- The majority of the growth in government employment has been in state and local government (101%).

- Is the size of government getting bigger? One way to answer this is to look at whether government employment has grown. If so, what type of government employment, and how does it compare to population growth? The figures on this page show government employment by type.

Source: BEA REIS 2005 Table CA25 and CA25N

$$\text{Average Earnings per Job} = \frac{\text{Total Wages Earned}}{\text{Total \# of Workers}}$$

- Average earnings per job, adjusted for inflation, have risen from \$28,621 in 1970 to \$28,749 in 2005.
- In 2005, Average earnings per job in 4 County Aggregation (\$28,749) were lower than the state (\$47,057) and the nation (\$45,817).

### How well do we recover from recessions?

- In the current recovery (2001 to 2005), earnings per job growth in 4 County Aggregation (up 1.1%) have outpaced the United States and State.
- Alternatively, in the last recovery (1991 to 2001), State (up 1.6%) grew the fastest.
- In the recovery from 1982 to 1990, the United States (up 0.9%) grew the fastest.

### Reasons why earnings per job may change over time:

- 1) Average earnings per job statistics include full and part-time employment. In some counties only a portion of the eligible workforce works full-time, driving down wage statistics. Run an EPSC profile to see the percentage of people working full-time.
- 2) Communities with an increase in tourism may see a decline in earnings due to a rise in seasonal (part-time) workers.
- 3) Communities that have established themselves as regional retail trade centers may see a decline in wages due to the low wages paid in retail trade.
- 4) Structural changes may have resulted in the loss of relatively high-wage occupations. Look at the long-term trends in employment, by industry, and compare to the nation and other counties. Are the changes local, or part of nation-wide trends?
- 5) More women have entered the workforce, and because of relatively lower pay, or because of fewer hours worked (depending on the region both may occur), earnings may decline over time. For a comparison of male versus female income run an EPSC profile.
- 6) Earnings will decline if job growth is primarily from low-wage services industries. Look at the breakdown of different industrial sectors to see the type of service industries that are growing. Does the community have what it takes (education, airports, amenities, etc.) to attract the high-wage service industries (engineering, finance, etc.)?
- 7) People may be choosing to live in some communities for quality of life reasons. In some areas the increase in population can outpace the rate of job creation, thereby flooding the labor market and causing a downturn in wages. Look at the growth rates of population relative to growth in jobs and personal income.

Source: BEA REIS 2005 Table CA30

$$PCI = \frac{\text{Total Personal Income}}{\text{Population}}$$

Per capita income is often used as a measure of economic performance, but it should be combined with changes in earnings for a realistic picture of economic health:

Since total personal income includes income from 401(k) plans as well as other non-labor income sources like transfer payment, dividends, and rent, it is possible for per capita income to rise, even if the average wage per job declines over time. In other words, the non-labor sources of income can cause per capita income to rise, even if people are earning less per job.

- Per capita income, adjusted for inflation, has risen from \$16,870 in 1970 to \$23,432 in 2005.
- In 2005, per capita income in 4 County Aggregation (\$23,432) was lower than the state (\$35,479) and the nation (\$34,471).

How well do we recover from recessions?

- In the current recovery (2001 to 2005), per capita income growth in the United States (up 0.6%) has outpaced 4 County Aggregation and State.
- Alternatively, in the last recovery (1991 to 2001), State (up 1.8%) grew the fastest.
- In the recovery from 1982 to 1990, the United States (up 2.4%) grew the fastest.

Source: BEA REIS 2005 Table CA30

The advantage of this data source is that it never has disclosure restrictions. This source also releases data for hundreds of sectors (available on demand). The data on this page are from the US Census County Business Patterns, which unlike the REIS data, does NOT include proprietors, government, household services or railroad workers. If available, we encourage you to look at employment and income data from BEA REIS starting on page 26 as well.

**Growth**

- The employment category whose share of total gained the most was services, which went from 20.9% in 1977 to 30.0% in 1997.

**Decline**

- The category whose share of total shrank the most was retail trade, which went from 34.5% in 1977 to 25.7% in 1997.

County Business Patterns Number of Establishments

This page is blank because the system does not contain commuting data for this geography.

## 4 County Aggregation

# Agriculture (Business Income)

Farm income figures presented on this page reflect income from farming *enterprises* (income of the business). The term "farm" includes farming and ranching, but not agricultural services such as soil preparation services and veterinary services. In contrast, farm income figures presented in the next section reflect personal income earned by *individuals* (income of individuals, both proprietors and wage and salary employees) who work in farming and ranching.

Farm income of businesses differs from individual farm income because it also includes government payments, rent, the value of inventory change and production expenses. In some areas, net farm income can be negative when production expenses exceed gross income.

Gross Income, Expenses, and Net Income from Farming and Ranching							
All figures in thousands of 2005 dollars	1970	% of Gross Income	1995	% of Gross Income	2005	% of Gross Income	70-04 Change in Share

### Gross Income vs. Production Expenses

### Net Farm Income

Source: BEA REIS 2005 CD Table CA45

**In the following pages (23-25) you will learn about:**

1. The economic diversity of the county, compared to the state and the nation.
2. The year to year stability of personal income growth, comparing the county to the state and the nation.
3. The stability of personal income over time, comparing labor versus non-labor income.
4. If this is a county profile, numerous performance characteristics of the county (population growth, employment growth, employment stability, etc.), are used to compare the county to the median county in the country (a “benchmark”).

Stability vs. State and Nation

- Different regions can behave very differently during recessions and recoveries.
- Note: Below 0% means absolute decline. Above 0% means absolute growth, but at different rates.

Labor vs. Non-Labor Income Stability

- Non-labor income sources can have a stabilizing effect on the economy and are sometimes, but not always, counter-cyclical to labor income.

Source: BEA REIS 2005 Table CA30

## 4 County Aggregation

## Performance Comparisons

Benchmark = Median of all Counties in U.S.\*\*\*

Compared to benchmark area, the county has:  
 ← Less Than | More Than →

	4 County Aggregation	US Median
<b>Population Growth (Annualized rate, 1970-2005)</b>	1.9%	0.6%
<b>Employment Growth (Annualized rate, 1970-2005)</b>	2.0%	1.4%
<b>Personal Income Growth (Adjusted for Inflation, Annualized rate, 1970-2005)</b>	2.8%	2.2%
<b>Non-labor Income Share of Total in 2005</b>	42.0%	37.1%
<b>Median Age*</b>	39.2	37.3
<b>Per Capita Income (2005)</b>	\$ 23,432	\$ 26,371
<b>Average Earnings Per Job (2005)</b>	\$ 28,749	\$ 30,269
<b>Education Rate</b> (% of population 25 and over who have a college degree)*	15.1%	14.5%
<b>Employment Specialization*</b>	795.9	961.0
<b>Ratio Rich/Poor</b> (Number of households that made under \$30K for every household that made over \$100K)*	11.1	8.7
<b>Housing Affordability</b> (100 or above means that the median family can afford the median house)*	133	186
<b>Change in Housing Affordability (1990-2000)*</b>	-8.5%	10.3%
<b>Government share of Total employment</b>	23%	15%
<b>Unemployment Rate in 2006**</b>	7.1%	4.7%

All data are from REIS except \* are from 2000 US Census and \*\* is from Bureau of Labor Statistics.

\*\*\*Median is the middle value of a list of numbers. This is different from mean (average), which is the sum of all the numbers in a list divided by the number of numbers in the list.

**In the following pages (28-31) you will learn about:**

1. Long-term employment and personal income trends, from 1970 to 2005
2. How the structure of the economy has changed during the last three decades

Information for some industries and for some years may not be available from the U.S. Department of Commerce because of disclosure restrictions.

**What is a 'disclosure restriction'?**

A disclosure restriction means a gap exists in the data. Information has been suppressed by the U.S. Department of Commerce to avoid disclosure of confidential information. Generally, the smaller the geographic level of analysis and the smaller the population of the county, the higher the chances that industry-specific information is suppressed and that disclosure restrictions will occur.

Our model to estimate the disclosure restrictions currently provides estimates for employment and income using the SIC classification method through 2000 for the western states only.

### Important Notes on the Industrial Classification Systems used by EPS

The U.S. Department of Commerce made a transition in how economic information is gathered and organized in 2001. The Standard Industrial Classification System (SIC) was used from 1970 to 2000; the North American Industrial Classification System (NAICS, pronounced “nakes”) is used currently, for data from 2001 and beyond.

Unfortunately the two systems are not backward comparable, so they are presented separately in EPS: 1970 to 2000 data are organized by SIC, and data beyond those years are organized by NAICS.

The most important change resulting from the shift to NAICS is the recognition of hundreds of new businesses in today's economy. NAICS divides the economy into 20 broad sectors rather than the SIC's 10 divisions. This is especially helpful in giving a more detailed breakdown of the fastest growth area in the country's economy – “services.” For example, advanced technology related “service” industries (e.g., professional, scientific and technical services) are clearly differentiated from “in-person” services (e.g., health care) and low-wage services (e.g., accommodation and food services).

For historical data (1970-2000, organized by SIC) EPS was designed to illustrate the complexity of the service economy in a couple of ways:

- 1) We use the term "Services and Professional" to underscore an important point: service occupations are not just “hamburger flippers and maids,” but rather consist of a combination of high-paying and low-paying professions, mixing physicians with barbers, and chambermaids with architects and financial consultants.
- 2) We reorganized the SIC categories into different types of services, such as Consumer Services, Producer Services, Social Services, and Government Services.

The transition to NAICS has alleviated the need to explain that “services” are actually a wide mix of low, medium, and high-wage industries.

### About Missing Data

This profile is organized so that all non-disclosed information is presented first. Employment and personal income by industry is presented last. For some rural counties, and for some industries, data gaps may occur. EPS has a built-in system for estimating data gaps through 2000 for the 11 contiguous western states (AZ, CA, CO, ID, MT, NM, NV, OR, UT, WA, WY). When estimates are used in the tables on pages 28 and 30, they are highlighted in bold red text.

Data ends in 2000 because the BEA switched to a different classification system (NAICS) in 2001.

**Growth**

- The employment category whose share of total gained the most was services and professional, which went from 36.4% in 1977 to 44.8% in 2000.

**Decline**

- The category whose share of total shrank the most was manufacturing (incl. forest products), which went from 14.4% in 1977 to 9.5% in 2000.

**Employment by Industry Changes from 1977 to 2000**

	1977	% of Total	2000	% of Total	New Employment	% of New Employment	Change in Share
Total Employment	28,804.0		45,385.0		16,581.0		
Wage and Salary Employment	21,739.0	75.5%	32,194.0	70.9%	10,455.0	63.1%

### Data Sources

The Economic Profile System was designed to focus on long-term trends at the county level. We used this method and geographic scale for several reasons: (1) trend analysis provides a more comprehensive view of change than spot data for select years, (2) the most reliable information on long-term employment and income trends is available at the county level, and (3) communities within counties rarely function as economic units themselves. Finally, even though in many areas the most accurate geographic scale to understand economic changes may be at the multi-county or regional level, county-level data is useful in the context of existing political jurisdictions, such as county commissions and planning departments. The list below contains the World Wide Web sites and telephone numbers for the databases used in this report:

### Use of Federal Rather than State Data Bases

Data from state agencies was not used for this profile. Many of the state and local sources of data do not include information on the self-employed or on the importance of non-labor income, such as retirement income and money earned from past investments. In many counties this can result in the underestimation of employment and total personal income by at least one third. The REIS disk of the Bureau of Economic Analysis contains the most robust data set and for this reason it was used as the primary source.

The only disadvantage of the REIS dataset is it's not as recent; 2005 is the latest for REIS, while state data sources provide data for as recent as 2006. By providing long-term trends data, from 1970 to 2005, having the most recent data is less important than being able to discern where the county's economy has been, and the direction in which it has been headed in recent years.

### Industrial Classification Systems (SIC & NAICS)

The long-term historic industry data used in this profile are based on data that is organized by the U.S. Department of Commerce using the Standard Industrial Classification (SIC) system. In recent years, the Department of Commerce has reorganized economic data according to a new system, called the North American Industry Classification System (NAICS, pronounced "nakes"). County Business Patterns started organizing their data using new NAICS in 1998, Census in 2000, and the Regional Economic Information System (REIS) in 2001.

The NAICS system is an improvement to the SIC system in several ways: first, businesses that use similar processes to produce goods or services are classified together. Previously, under the SIC system, some businesses were classified on the basis of their production processes while others were classified under different principles, such as class of consumer. Second, NAICS is a flexible system that will be updated every five years in order to keep pace with changes in the economy. Third, the NAICS system recognizes the uniqueness and rising importance of the "information economy," and provides several new categories, such as cable program distributors and database and directory publishers. Finally, and perhaps the most useful, the NAICS system provides seven sectors to better reflect services-producing businesses that were previously combined into one generic SIC division (the Services division).

This new system allows the data user to differentiate more clearly between what was previously often lumped under the general heading of "services," into categories such as arts and entertainment; education; professional, scientific and technical services; health care and social assistance, among others.

Arguably the most important change of NAICS is the recognition of hundreds of new businesses in the economy. NAICS divides the economy into 20 broad sectors rather than the SIC's 10 divisions as seen in the table on the following page. Creating these additional sector-level groupings allows NAICS to better reflect key business activities, as well as chronicle their changes.

### SIC Divisions vs. NAICS Sectors

SIC Divisions	NAICS Sectors
<ul style="list-style-type: none"> <li>• Agriculture, Forestry, and Fishing</li> </ul>	<ul style="list-style-type: none"> <li>• Agriculture, Forestry, Fishing and Hunting</li> </ul>

### Non-Labor Income

Non-labor income is a mix of Dividends, Interest, and Rent (money earned from past investments), and Transfer Payments (government payments to individuals). Private pension funds (e.g. 401(K) plans) are not counted as part of transfer payments.

Some data sources, such as "Section 202" data available from state unemployment insurance records and reported by the Bureau of Labor Statistics, do not report non-labor income. The Bureau of Economic Analysis (BEA), on the other hand, tracks non-labor income. In order to understand the actual growth (labor and non-labor) of personal income, the REIS/BEA data set must be used, and this is what was used for this profile. From REIS table CA05, we added together the following two categories to derive non-labor income: "Personal current transfer receipts" and "Dividends, interest, and rent."

### Disclosure Gaps

Some data, such as employment and income figures in counties with small economies, are not available because of confidentiality restrictions. In order to protect information about individual businesses, data are sometimes suppressed or, in the case of the publication County Business Patterns, a range of values are given instead of a specific value. Generally, the smaller the geographic level of analysis or the smaller the economy under examination the higher the chances that industry-specific information will be suppressed.

Where disclosure gaps exist, the EPS User's Manual outlines a few ways to handle the gaps. One approach is to use a built-in system within EPS for estimating data gaps through 2000 for the 11 contiguous western states (AZ, CA, CO, ID, MT, NM, NV, OR, UT, WA, WY). In order to calculate the estimates, we first estimated gaps in the County Business Patterns data by using the firms by size information. Then we used these County Business Patterns data to estimate the gaps in the REIS data. Finally, we scaled the estimates up or down to force known identities. There is an option in EPS to either show these estimates or not. When these estimates are shown, annotations were made in the profile documenting where estimates were used. For a description of the methods used to estimate the data gaps in EPS, see the EPS User's Manual.

### Aggregated Profiles

The economic profile system has an option to allow you to aggregate data from multiple counties into one profile. The majority of the data in the profiles are summed in the aggregate profile. For some data points, however, the data are averaged. In order to do this, EPS has to replace some of the data in the raw data tables with formulae. For example, the aggregate unemployment rate for a group of counties is calculated from the sum of the unemployed divided by the sum of the labor force. This results in a proportionally weighted average, where larger counties are given more weight than smaller counties.

The Economic Profile System interpolates the medians from the data that are available. When the Census releases data expressed as a median, they also release the number of observations that fall in the full range of categories, or "brackets". For example, median age is interpolated from the number of people in each age bracket. EPS aggregates the number of people in each bracket, and then interpolates the median from the aggregated data. In some cases, the Census have more detailed brackets than we do in the EPS databases so the interpolations in aggregated EPS profiles are rough estimates.

### Adjustments from Current to Real Dollars

Because a dollar in the past was worth more than a dollar today, data reported in current dollar terms should be adjusted for inflation. The U.S. Department of Commerce reports personal income figures in terms of current dollars. All income data in this profile were adjusted to real (or constant) 2005 dollars using the Consumer Price Index, except the Income Distribution information on page 5 of the profile.

### Unemployment Rate

Unemployment is generally available as seasonally unadjusted or adjusted, and there is an advantage to using adjusted data. From the Bureau of Labor Statistics web site (<http://stats.bls.gov/lauseas.htm>), an explanation of why adjusted figures should be used, whenever possible: "Over the year, the size of the Nation's labor force, the levels of employment and unemployment, and other measures of labor market activity undergo sharp fluctuations due to seasonal events including changes in weather, harvests, major holidays, and the opening and closing of schools. Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make it easier to observe the cyclical, long term trend, and other non-seasonal movements in the series."

Unadjusted numbers were used in this profile in order to obtain an annual average and because county-level data are not available in adjusted format from the Bureau of Labor Statistics web site. This may introduce some error in counties where the size of the workforce fluctuates seasonally, such as tourist destination areas.

### Farm Income

Note that farm income figures on pages 21 are not the same as the figures on pages 30 & 31. The figures on page 21 reflect income from farming *enterprises* (farm proprietors and corporate income), while the farm income on pages 30 & 31 is personal income earned by *individuals* (both proprietors, and wage and salary employees) who work in farming.

### Specialization Index

The specialization index was calculated as:

$$\text{SPECIAL}_{it} = \sum_{j=1}^n (\text{EMP}_{ijt} / \text{EMP}_{it})^2$$

$\text{SPECIAL}_{it}$  = specialization of economy in county i in year t

$\text{EMP}_{ijt}$  = employment in industry j in county i in year t

$\text{EMP}_{it}$  = total employment in county i in year t

n = number of industries

This index is commonly used as a measure of industrial specialization in the economy. Counties with a high specialization index can also be described as not being economically diverse.

### Income

- Total Personal Income = private earnings, income from government and government enterprises, dividends, interest, and rent, and transfer payments plus adjustments for residence minus personal contributions for social insurance.
- Wage and salary = monetary remuneration of employees, including employee contributions to certain deferred compensation programs, such as 401K plans.
- Other labor income = payments by employers to privately administered benefit plans for their employees, the fees paid to corporate directors, and miscellaneous fees.
- Proprietors' income = income from sole proprietorships, partnerships, and tax-exempt cooperatives. A sole proprietorship is an unincorporated business owned by a person. A partnership is an unincorporated business association of two or more partners. A tax-exempt cooperative is a nonprofit business organization that is collectively owned by its members.

### Transfer Payments

- Transfer payments = payments to persons for which they do not render current services. As a component of personal income, they are payments by government and business to individuals and nonprofit institutions.
- Retirement & disab. insurance benefit payments = Old-Age, Survivors, and Disability Insurance payments (Social Security), Railroad Retirement and Disability payments, Federal Civilian Employee & Disability Payments, Military Retirement, and State and Local Government Employee retirement payments.
- Medical payments = Medicare, public assistance medical care and CHAMPUS payments.
- Income maintenance (welfare) = Supplemental Security Income (SSI), Aid to Families with Dependent Children (AFDC), Food Stamps, and Other Income Maintenance Payments, such as emergency assistance, foster care payments and energy assistance payments.
- Unemployment insurance benefit payments = unemployment compensation for state and federal civilian employees, unemployment compensation for railroad workers, and unemployment compensation for veterans.
- Veterans benefits = primarily compensation to veterans for their disabilities and payments to their survivors.
- Federal education and training assistance = Job Corps payments, interest payments on Guaranteed Student Loans, federal fellowship payments, and student assistance for higher education.
- Other government payments = compensation of survivors of public safety officers and compensation of victims of crime. In Alaska this item includes Alaska Permanent Fund payments.
- Payments to nonprofit institutions = payments for development and research contracts. For example, it includes payments for foster home care supervised by private agencies.
- Business payments to individuals = personal-injury liability payments, cash prizes, and pension benefits financed by the Pension Benefit Guarantee Corporation.

### Mean, Median and Modes

- Mean = The sum of a list of numbers, divided by the total number of numbers in the list.
- Median = "Middle value" of a list. The smallest number such that at least half the numbers in the list are no greater than it. If the list has an odd number of entries, the median is the middle entry in the list after sorting the list into increasing order. If the list has an even number of entries, the median is equal to the sum of the two middle (after sorting) numbers divided by two. The median can be estimated from a histogram by finding the smallest number such that the area under the histogram to the left of that number is 50%.
- Mode = For lists, the mode is the most common (frequent) value. A list can have more than one mode. For histograms, a mode is a relative maximum ("bump").
